approximately 40% (628 mGy cm²); this protocol resulted in a value of effective dose of 35 microSievert (μSv). Moreover, the effect of changing FOV has been evaluated, considering two scans with a reduced FOV (160 × 140 and 120 × 90 mm, respectively).

CONCLUSIONS: CBCT low-dose protocol with large FOV, normal resolution quality images, 80 kVp, 5 mA and acquisition time of 15 s resulted in a value of effective dose of 35 microSievert (μSv). This protocol allows the study of maxillofacial region with high quality of images and a very low radiation dose and, therefore, could be proposed in selected case where a complete assessment of dental and maxillofacial region is useful for treatment planning.

Ricostruzioni Cone Beam

Pianificazione di trattamento

- Trattamento con allineatori passivi.
Esercizi anti-serramento.
Fisioterapia con esercizi di allungamento e potenziamento della muscolatura paravertebrale.
- Trattamento con allineatori attivi Invisalign.
Esercizi anti-serramento.
Fisioterapia con esercizi di allungamento e potenziamento della muscolatura paravertebrale.
